Within the framework of meeting ever-growing needs for more accurate and updated geographic data, our company, offers a plethora of solutions

Our company provides complete state-of-the-art technology solutions and services within a project's framework, but can also provide geographic data separately according to customer needs.

More specifically, we offer:

Mobile Mapping:

This is a unique system which includes rapid data collection while maintaining cost at low levels. It is used for recording road data and signs, facilities and roadwork. It is accompanied by software which comprises a panoramic output of data recorded in the field, allowing measurement and export of all indexed data. It also includes panoramic videos of all roads.

PixoView:

This is a highly advanced system for collecting lateral (oblique) aerial imagery which includes very user-friendly software with an extensive library of objects where each point can be displayed at from 4 to 12 different angles. These objects are linked to a raster image, orthophotomap or other vector data. As a result, the user can have a complete imaging of reality with the ability to measure lengths, heights, areas, or to extract coordinates.

Aerial photographs and DTM generation:

We undertake the generation of DTM (Digital Terrain Model) and DSM (Digital Surface Model) aerial photographs with maximum resolution and accuracy for projects which involve the imaging of an area, with PixoView.

Applications:

The data we provide can be used in a plethora of solutions and applications, and therefore addresses many organizations in the public sector (municipalities and regions, ministries, national defense, etc.), as well as specialized solutions in the private sector (road construction, mobile operators, large construction companies). If you would like further information about the products and solutions which our company provides, please contact us.
